3)Read the difference between window screen and document in javascript

- **The window is at a root top level at the JavaScript object hierarchy. It is a global root object in JavaScript and it is the root object of the Document object model(DOM).**

- **A document is an object inside the window object and we use a document object for manipulation inside the document.**

Syntax:

Window object:
```
window.propertyname;
```

Document object:
```
document.propertyname;

    // OR

window.document.propertyname;
```
